

Identifying Signaling Pathways

BMI/CS 776

www.biostat.wisc.edu/bmi776/

Spring 2020

Daifeng Wang

daifeng.wang@wisc.edu

Goals for lecture

- Challenges of integrating high-throughput assays
- Connecting relevant genes/proteins with interaction networks
- ResponseNet algorithm
- Evaluating pathway predictions
- Classes of signaling pathway prediction methods

High-throughput screening

- Which genes are involved in which cellular processes?
- Hit: gene that affects the phenotype
- Phenotypes include:
 - Growth rate
 - Cell death
 - Cell size
 - Intensity of some reporter
 - Many others

Types of screens

- Genetic screening
 - Test genes individually or in parallel
 - Knockout, knockdown (RNA interference), overexpression, CRISPR/Cas genome editing
- Chemical screening
 - Which genes are affected by a stimulus?

Differentially expressed genes

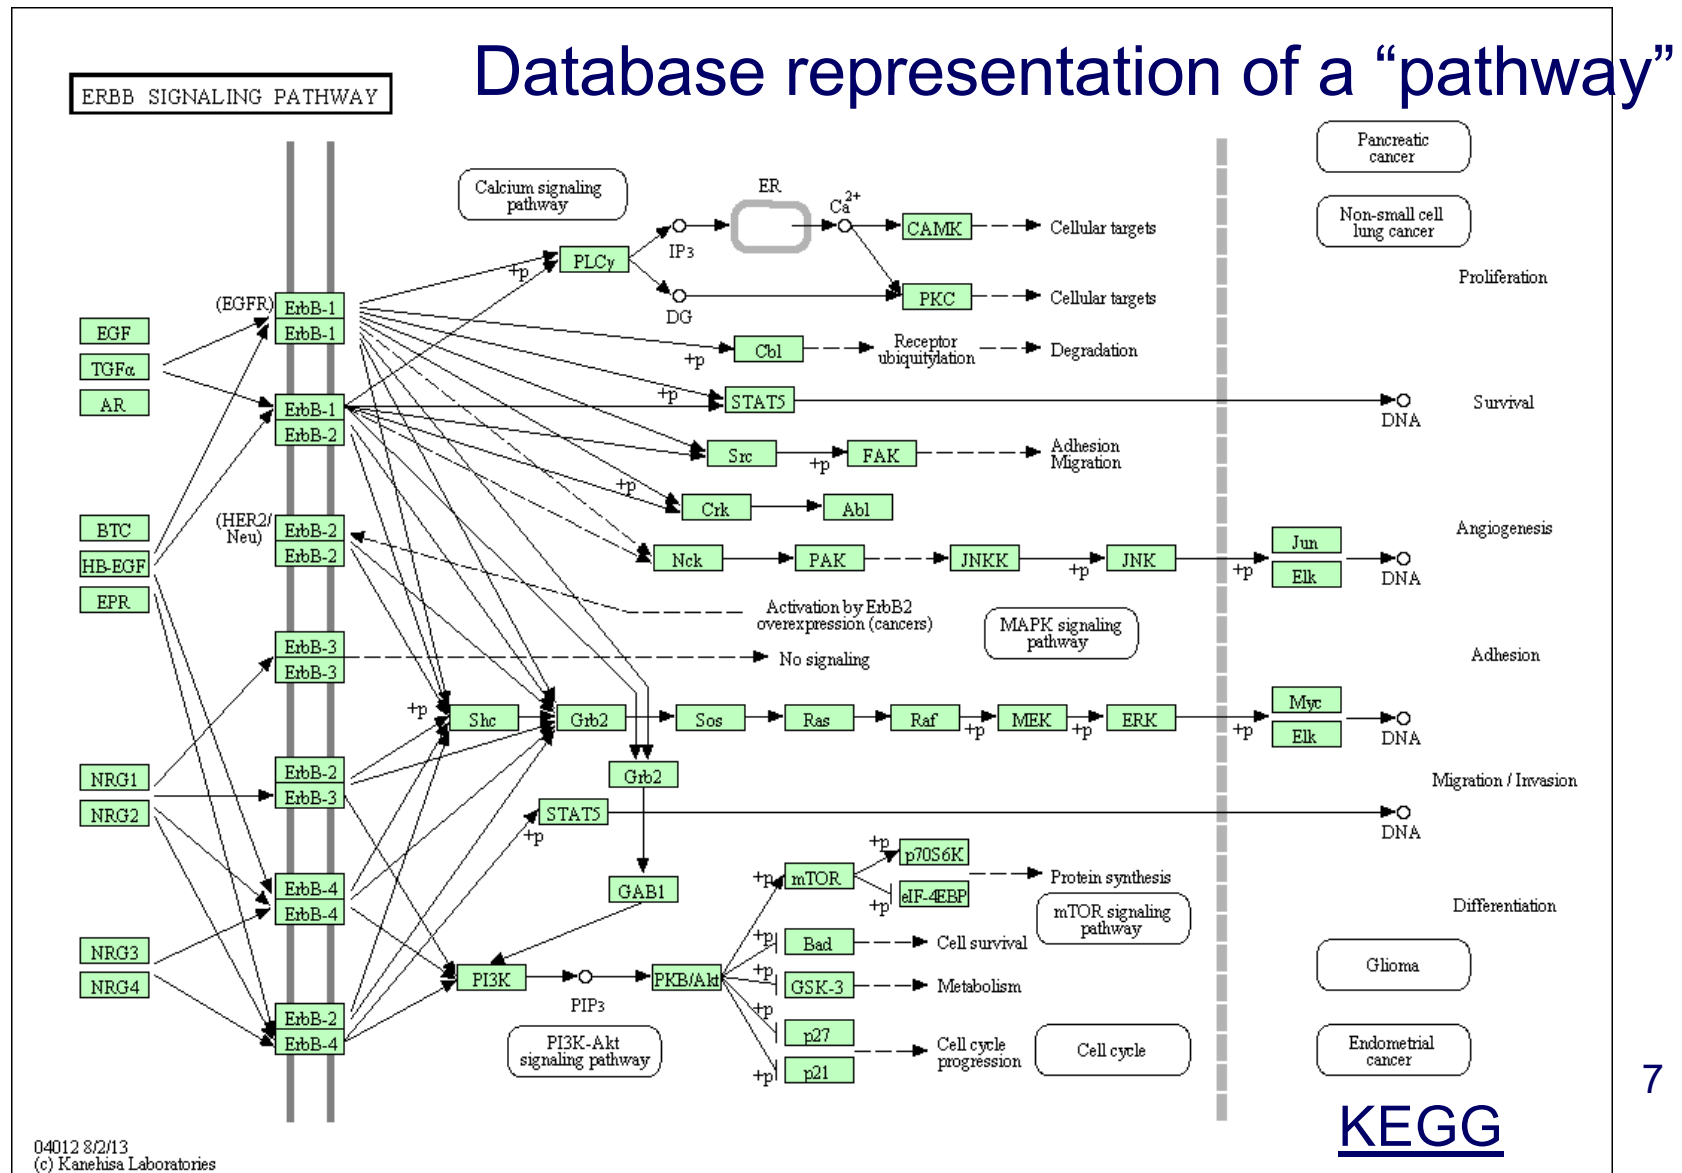

- Compare mRNA transcript levels between control and treatment conditions
- Genes whose expression changes significantly are also involved in the cellular process
- Alternatively, differential protein abundance or phosphorylation

Interpreting screens

Very few genes detected in both

Assays reveal different parts of a cellular process

Assays reveal different parts of a cellular process

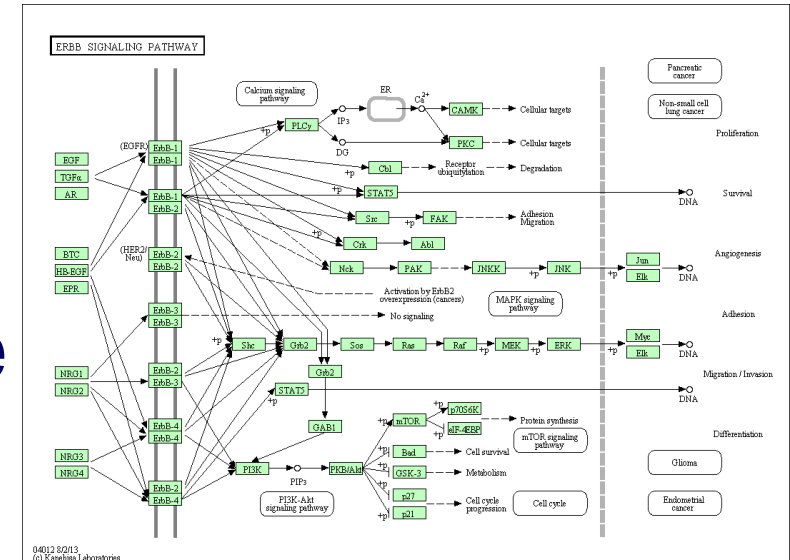

Differentially expressed genes

Genetic screen hits

Pathways connect the disjoint gene lists

- Can't rely on pathway databases
- High-quality, low coverage
- Instead learn condition-specific pathways computationally
- Combine data with generic physical interaction networks

Physical interactions

- Protein-protein interactions (PPI)

Appling Graz

- Metabolic
- Protein-DNA (transcription factor-gene)

Yeger-Lotem200

- Genes and proteins are different node types

Hairball networks

- Networks are highly connected
- Can't use naïve strategy to connect screen hits and differentially expressed genes

● Genetic hit
 ~ Differentially expressed gene
 ● Protein selected by ResponseNet
 → Interaction selected by ResponseNet
 → Interaction not selected by ResponseNet

Yeager-Lotem2009

Network problems

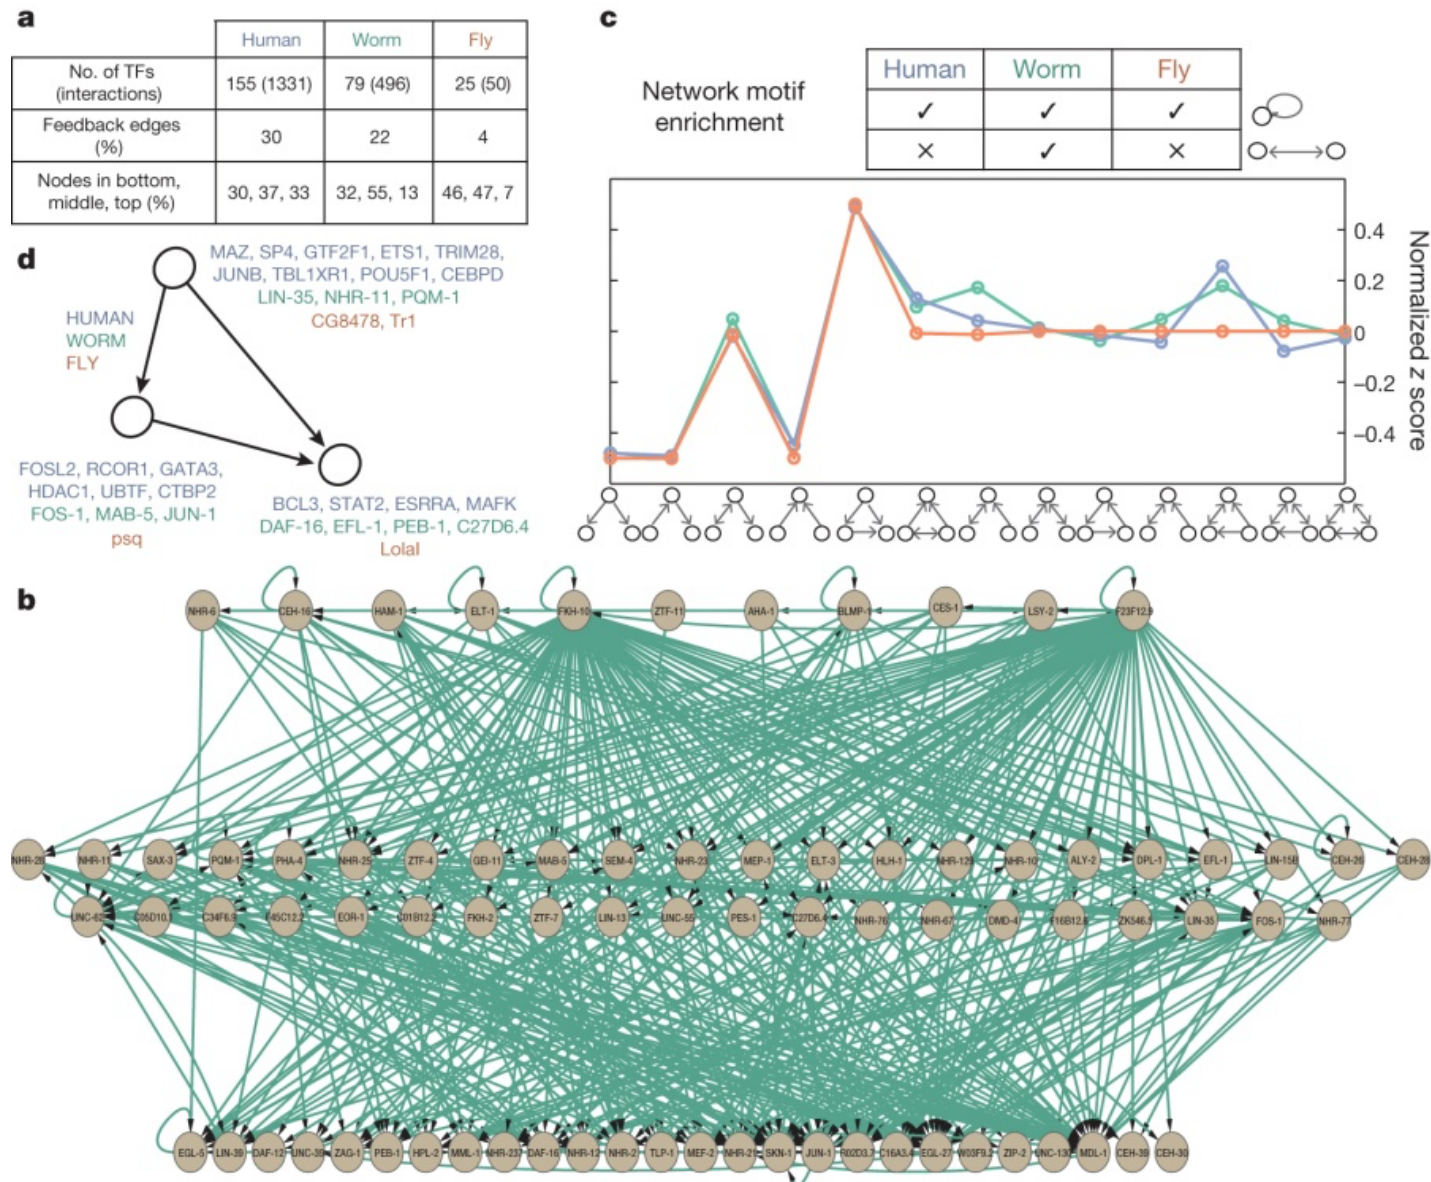

- Network inference
 - Infer network structure
- Motif finding
 - Identify common subgraph topologies
- Pathway or module detection
 - Identify subgraphs of genes that perform the same function or active in same condition
- Network comparison, alignment, querying
- Conserved modules
 - Identify modules that are shared in networks of multiple species/conditions

Network motifs

- Problem: Find subgraph topologies that are statistically more frequent than expected
- Brute force approach
 - Count all topologies of subgraphs of size m
 - Randomize graph (retain degree distribution) and count again
 - Output topologies that are over/under represented

Gene regulatory network motifs

Network modules

- Modules: dense (highly-connected) subgraphs (e.g., large cliques or partially incomplete cliques)
- Problem: Identify the component modules of a network
- Difficulty: definition of module is not precise
 - Hierarchical networks have modules at multiple scales
 - At what scale to define modules?

How to define a computational “pathway”

- **Given:**
 - Partially directed network of known physical interactions (e.g. PPI, kinase-substrate, TF-gene)
 - Scores on source nodes
 - Scores on target nodes
- **Do:**
 - Return directed paths in the network connecting sources to targets

Network flow problem

- Finding an optimal route by minimizing transportation costs from LA to NYC
 - $c_{i,j}$, the cost between City i and City j
 - $f_{i,j} = 1$ if in route, $= 0$ if not
 - $\operatorname{argmin}_f \sum_{i,j} c_{i,j} * f_{i,j}$ s.t. constraints

ResponseNet optimization goals

- Connect screen hits and differentially expressed genes
- Recover sparse connections
- Identify intermediate proteins missed by the screens
- Prefer high-confidence interactions
- Minimum cost flow formulation can meet these objectives

Construct the interaction network

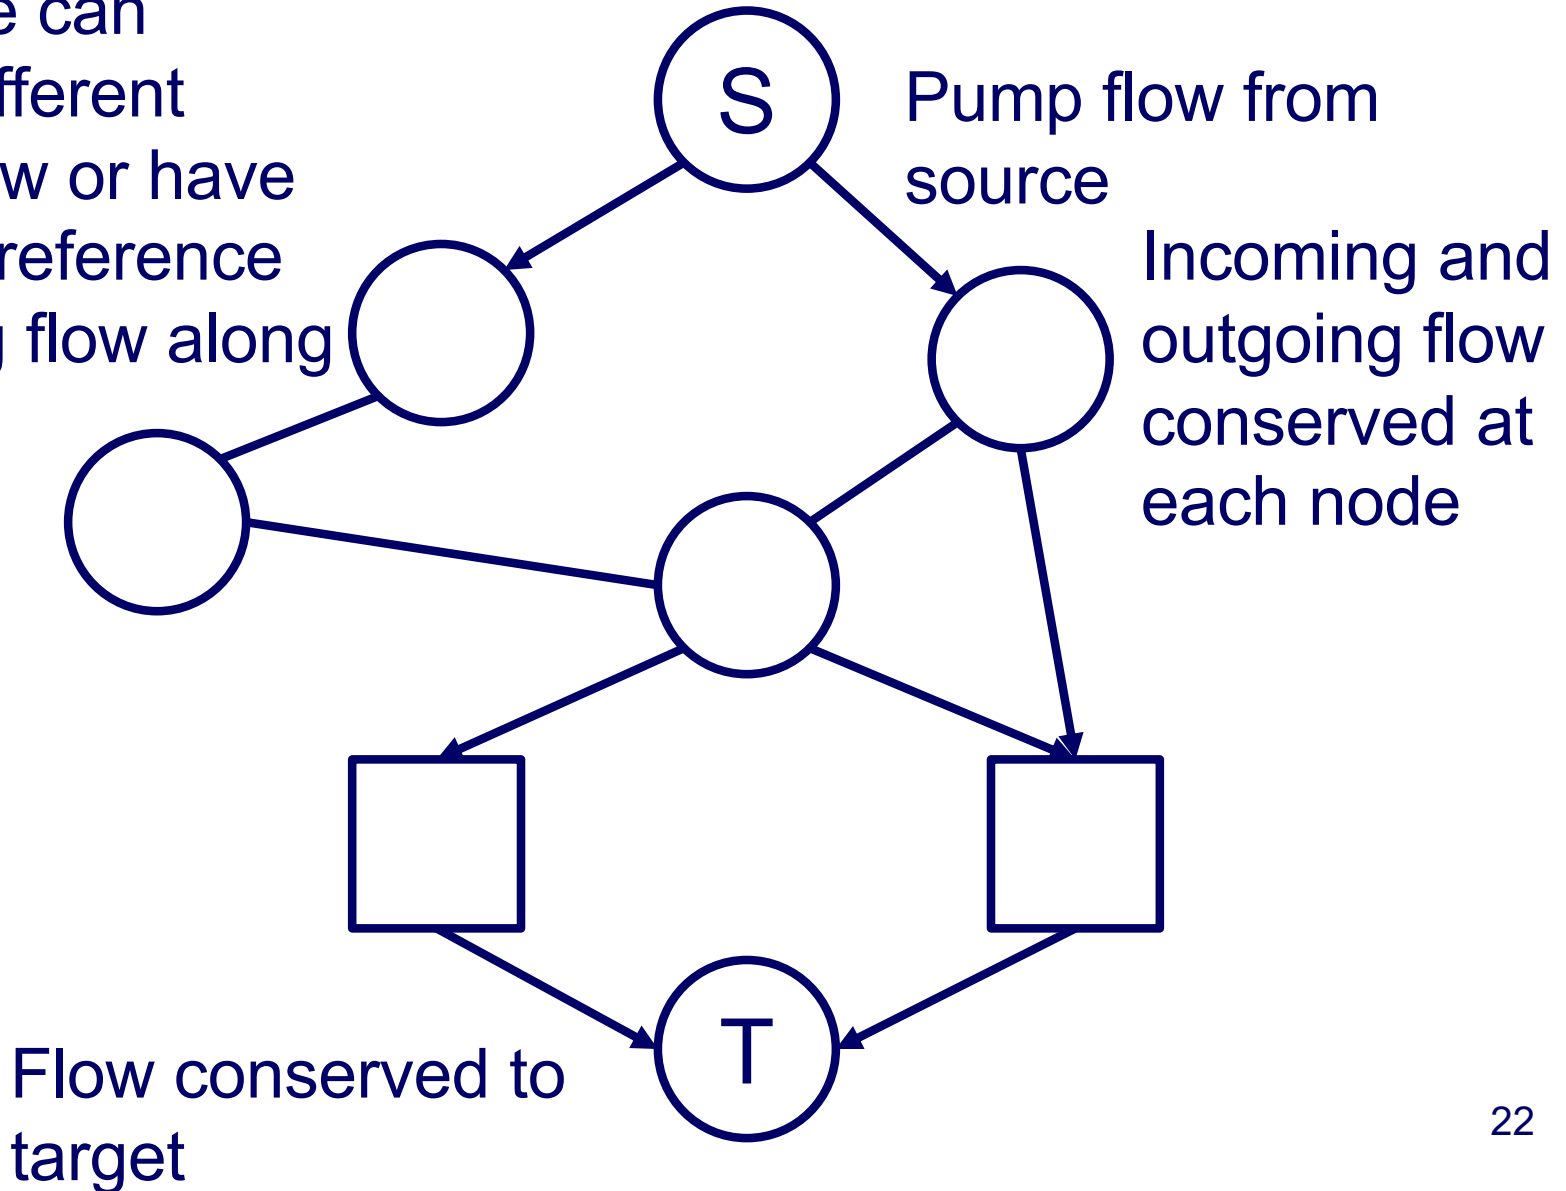

Transform to a flow problem

Max flow on graphs

Each edge can tolerate different level of flow or have different preference of sending flow along that edge

Weighting interactions

- Probability-like confidence of the interaction

Weights and capacities on edges

Find the minimum cost flow

Formal minimum cost flow

$$\min_f \left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} \right) - \left(\gamma * \sum_{i \in Gen} f_{Si} \right)$$

Positive flow on
an edge incurs a
cost

Flow on an
edge

Cost is greater for
low-weight edges

Parameter
controlling the
amount of flow from
the source

Formal minimum cost flow

$$\min_f \left(\left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} \right) - \left(\gamma * \sum_{i \in Gen} f_{Si} \right) \right)$$

Subject to:

$$\sum_{j \in V'} f_{ij} - \sum_{j \in V'} f_{ji} = 0 \quad \forall i \in V' - \{S, T\}$$

Flow coming in to a node
equals flow leaving the
node

Formal minimum cost flow

$$\min_f \left(\left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} \right) - \left(\gamma * \sum_{i \in Gen} f_{Si} \right) \right)$$

Subject to:

$$\sum_{j \in V'} f_{ij} - \sum_{j \in V'} f_{ji} = 0 \quad \forall i \in V' - \{S, T\}$$

$$\sum_{i \in Gen} f_{Si} - \sum_{i \in Tra} f_{iT} = 0$$

Flow leaving the
source equals flow
entering the target

Formal minimum cost flow

$$\min_f \left(\left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} \right) - \left(\gamma * \sum_{i \in Gen} f_{Si} \right) \right)$$

Subject to:

$$\sum_{j \in V'} f_{ij} - \sum_{j \in V'} f_{ji} = 0 \quad \forall i \in V' - \{S, T\}$$

$$\sum_{i \in Gen} f_{Si} - \sum_{i \in Tra} f_{iT} = 0$$

Flow is non-negative and does not exceed edge capacity

$$0 \leq f_{ij} \leq c_{ij} \quad \forall (i, j) \in E'$$

Formal minimum cost flow

$$\min_f \left(\left(\sum_{i \in V', j \in V'} -\log(w_{ij}) * f_{ij} \right) - \left(\gamma * \sum_{i \in Gen} f_{Si} \right) \right)$$

Subject to:

$$\sum_{j \in V'} f_{ij} - \sum_{j \in V'} f_{ji} = 0 \quad \forall i \in V' - \{S, T\}$$

$$\sum_{i \in Gen} f_{Si} - \sum_{i \in Tra} f_{iT} = 0$$

$$0 \leq f_{ij} \leq c_{ij} \quad \forall (i, j) \in E'$$

Linear programming

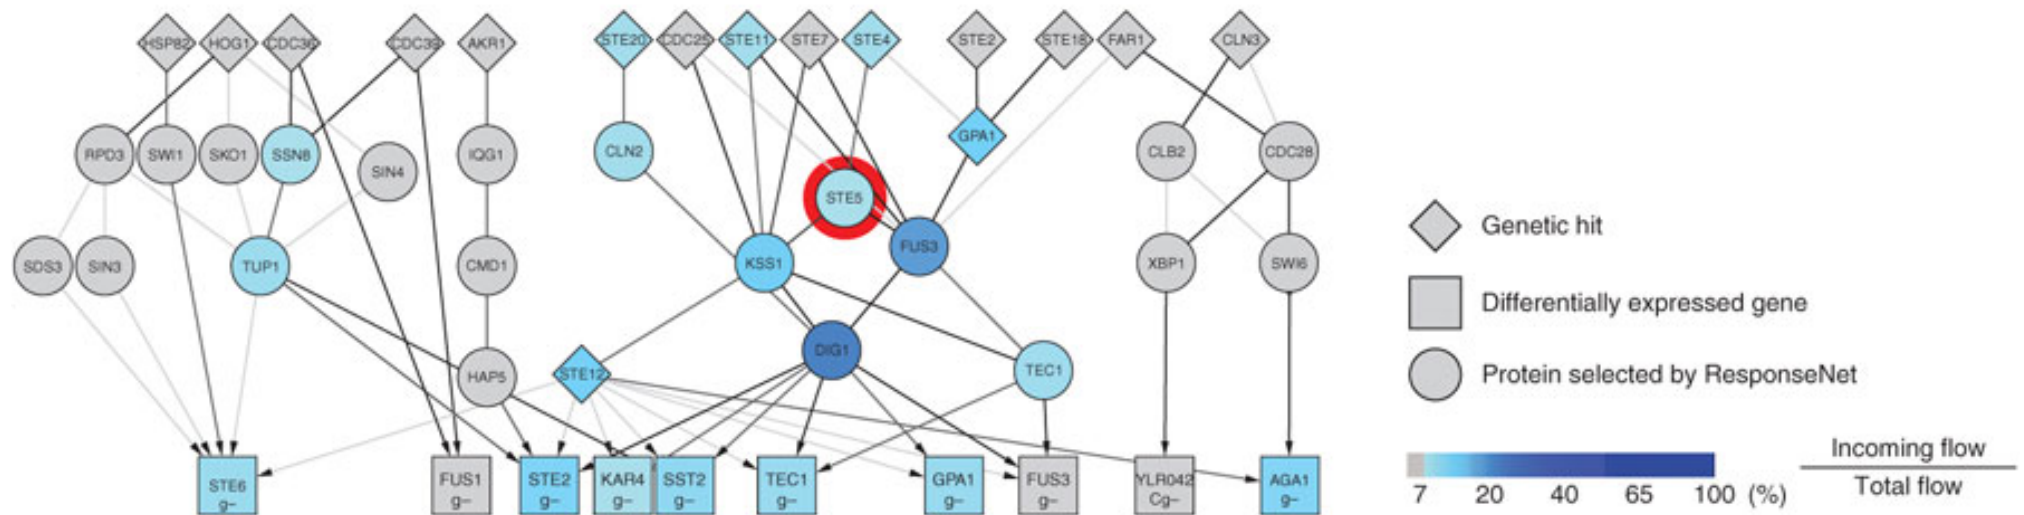

- Optimization problem is a linear program
- Canonical form

$$\begin{array}{ll}\text{maximize} & \mathbf{c}^T \mathbf{x} \\ \text{subject to} & A\mathbf{x} \leq \mathbf{b} \\ \text{and} & \mathbf{x} \geq 0\end{array}$$

- Practical Optimization: A Gentle Introduction
 - Introduction to linear programming
 - Simplex method
 - Network flow

ResponseNet pathways

- Identifies pathway members that are neither hits nor differentially expressed
- Ste5 recovered when *STE5* deletion is the perturbation

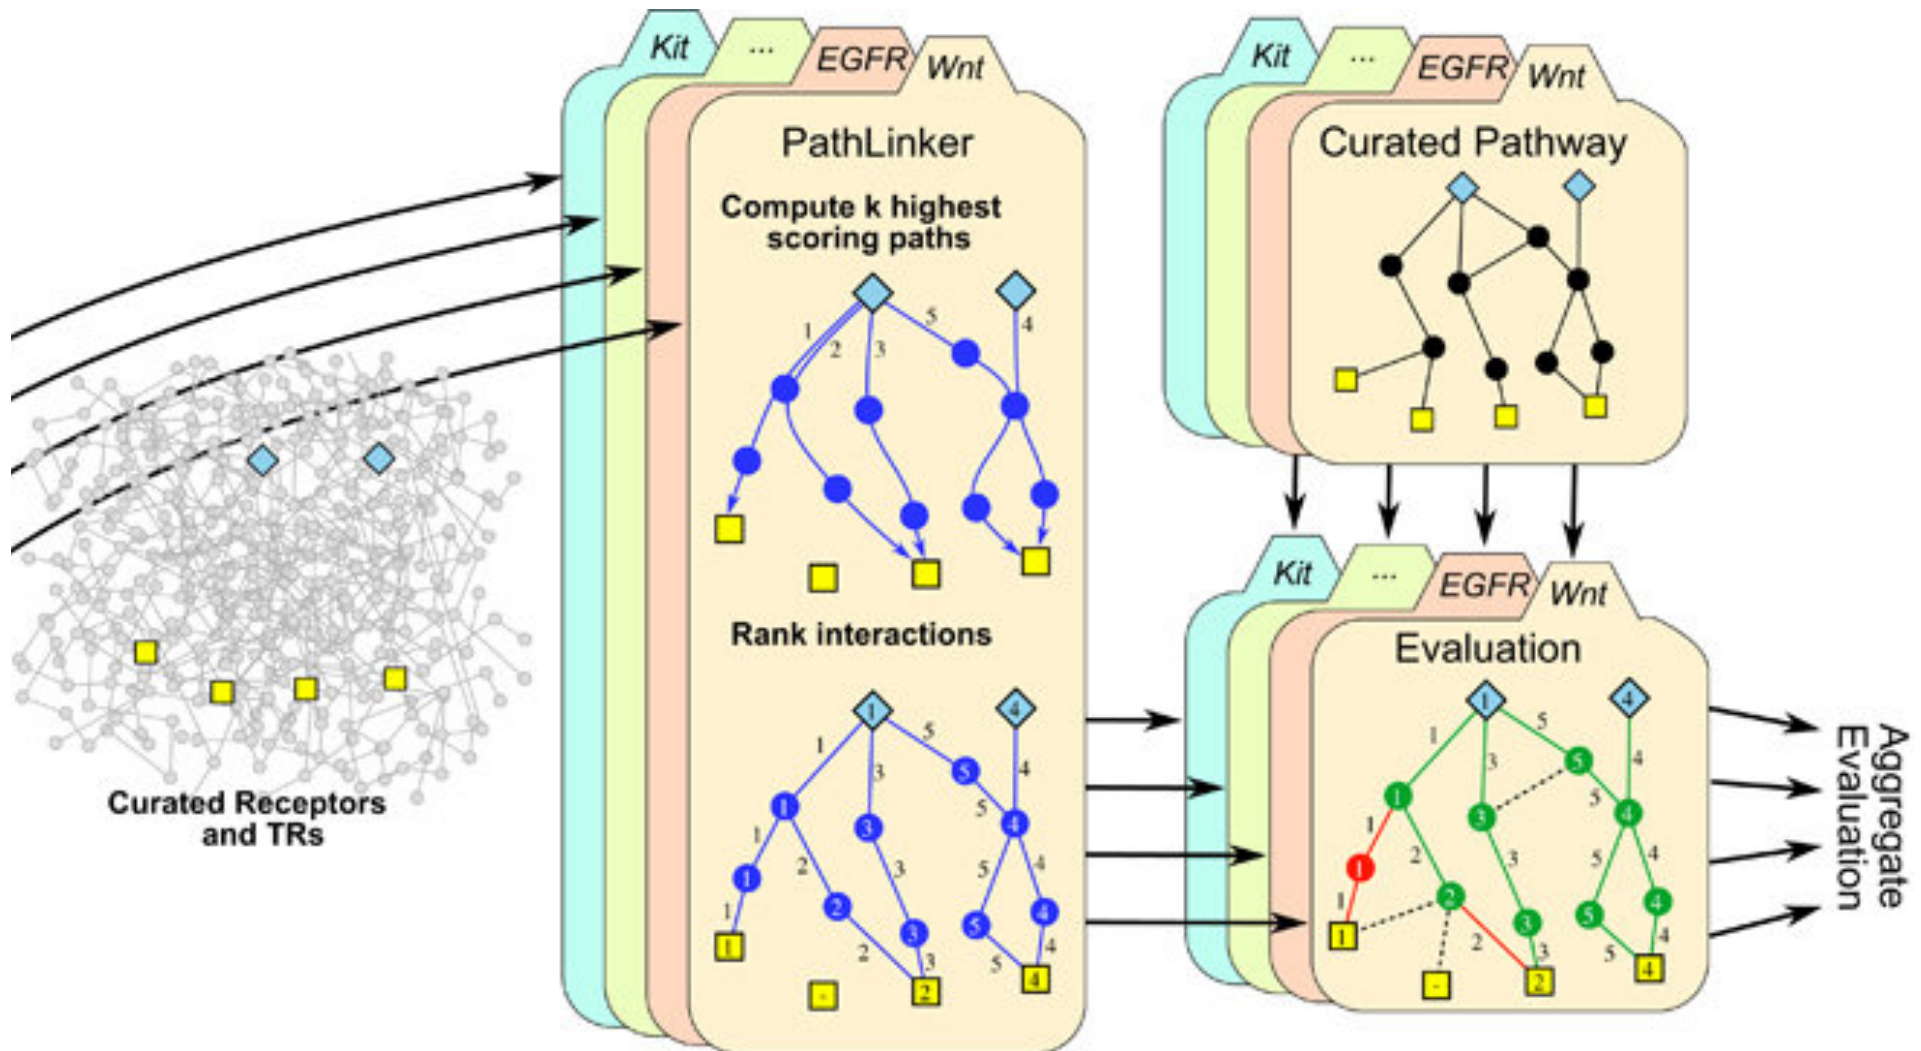

ResponseNet summary

- Advantages
 - Computationally efficient
 - Integrates multiple types of data
 - Incorporates interaction confidence
 - Identifies biologically plausible networks
- Disadvantages
 - Direction of flow is not biologically meaningful
 - Path length not considered
 - Requires sources and targets
 - Dependent on completeness and quality of input network

Evaluating pathway predictions

- Unlike PIQ, we don't have a complete gold standard available for evaluation
- Can simulate “gold standard” pathways from a network
- Compare relative performance of multiple methods on independent data

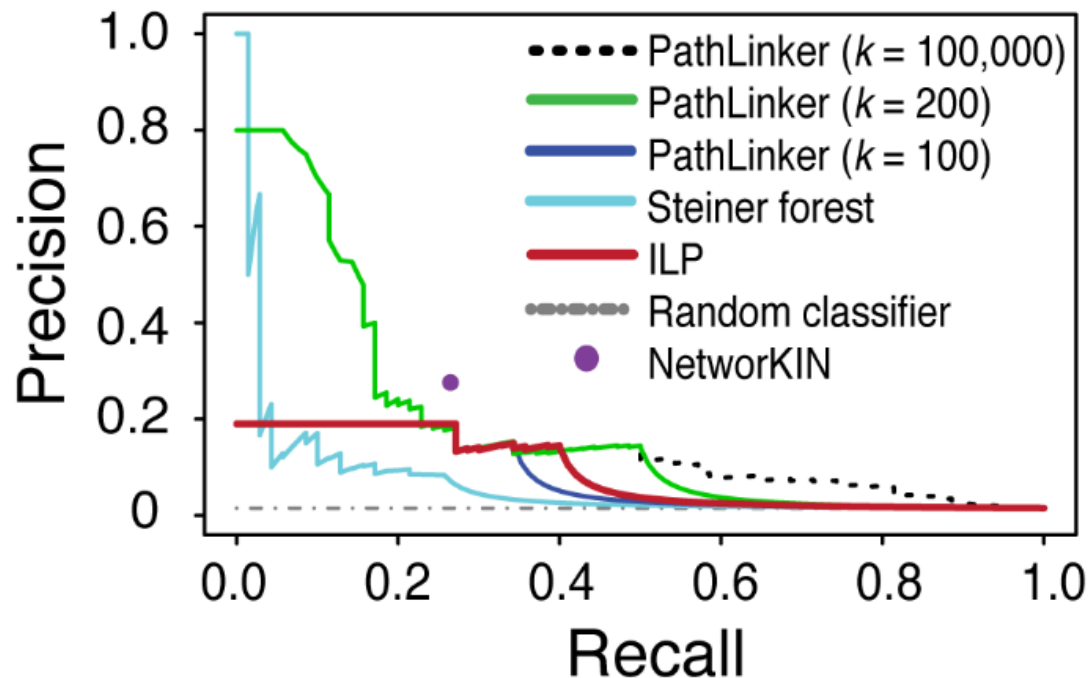

Evaluating pathway predictions

Evaluating pathway predictions

Evaluating pathway predictions

[MacGilvray2018](#)

- PR curves can evaluate node or edge recovery but not the global pathway structure

Evaluation beyond pathway databases

- Natural language processing can also help semi-automated evaluation

- Literome

Akt1 ☆, but not Akt2, phosphorylates palladin ☆ at Ser507 in a domain that is critical for F-actin bundling. [2010]

Classes of pathway prediction algorithms

Classes of pathway prediction algorithms

Alternative pathway identification algorithms

- k-shortest paths
 - Ruths2007
 - Shih2012
- Random walks / network diffusion / circuits
 - Tu2006
 - eQTL electrical diagrams (eQED)
 - HotNet
- Integer programs
 - Signaling-regulatory Pathway INference (SPINE)
 - Chasman2014

Alternative pathway identification algorithms

- Path-based objectives
 - Physical Network Models (PNM)
 - Maximum Edge Orientation (MEO)
 - Signaling and Dynamic Regulatory Events Miner (SDREM)
- Steiner tree
 - Prize-collecting Steiner forest (PCSF)
 - Belief propagation approximation (msgsteiner)
 - Omics Integrator implementation
- Hybrid approaches
 - PathLinker: random walk + shortest paths
 - ANAT: shortest paths + Steiner tree

Recent developments in pathway discovery

- Multi-task learning: jointly model several related biological conditions
 - ResponseNet extension: SAMNet
 - Steiner forest extension: Multi-PCSF
 - SDREM extension: MT-SDREM
- Temporal data
 - ResponseNet extension: TimeXNet
 - Steiner forest extension and ST-Steiner
 - Temporal Pathway Synthesizer

Condition-specific genes/proteins used as input

- Genetic screen hits (as causes or effects)
- Differentially expressed genes
- Transcription factors inferred from gene expression
- Proteomic changes (protein abundance or post-translational modifications)
- Kinases inferred from phosphorylation
- Genetic variants or DNA mutations
- Enzymes regulating metabolites
- Receptors or sensory proteins
- Protein interaction partners
- Pathway databases or other prior knowledge
